

Greenhouse gas emissions policy

Why is this a topic for Van Loon Group?

Greenhouse gas emissions and the associated climate change is one of the most important environmental issues today and will remain so for years to come. Van Loon Group's products and production processes produce greenhouse gas emissions. Van Loon Group has an obligation to comply with laws and regulations relating to this.

Demarcation

To calculate our CO₂ footprint, Van Loon Group takes into account Scope 1 and 2: the direct and indirect emissions from its own business activities. Van Loon Group also considers Scope 3: the indirect emissions generated as a result of activities 'upstream' and 'downstream' in the value chain.

Ambition

Van Loon Group is committed to the CO₂ reduction targets for 2030 validated by the Science Based Targeting initiative (SBTi). These targets are in line with the Paris Agreement to limit global warming to no more than 1.5°C.

The absolute emission reduction targets for 2030 with 2019 as the baseline year are:

Scope 1 & 2	66.2%
Scope 3 Fossil	46.2%
Scope 3 FLAG	33.3%

The largest CO₂ footprint of the end products is created 'upstream' in the cultivation of animal feed and emissions in the growing sheds. As supply chain director, Van Loon Group work together with livestock farmers and other partners in the supply chain to reduce the CO₂ footprint of the entire supply chain.

This policy and associated guidelines are periodically reviewed and updated as necessary. Van Loon Group ensures that this policy is clearly communicated.
